RFQ Bid Tracker: questions for Israel

The app shows each request with a status, a "Can we bid?" check, the deadline and the key requirements. To finish it with real data, we need your answers below. Short answers are fine.

1. About Discover Group

☐ **What lists, certifications and licences does Discover Group hold?** Examples: GSA Schedule, NASA SEWP, small business, MWBE, NY or NJ licences.
Why: the "Can we bid?" column compares each request against this list. It currently uses made-up values.
Answer: _____

☐ **Which regions and categories do you serve?** Should requests outside them be hidden automatically?
Answer: _____

2. What the app should show

☐ **Bonds and mandatory pre-bid meetings:** should each get its own column, since they can decide bid or no-bid?

☐ **Extra details:** do you want contact person, how to submit, and contract length shown?

☐ **Notes and outcomes:** do you want a note per request (e.g. why you passed) and Won / Lost statuses?

3. Where it runs, and keeping it private

Your Interested / Bidding / Passed choices show which bids you're pursuing, so we should decide this on purpose.

☐ **Who will use it?** Just you, or several people with logins? *Why:* several users means choices must be saved centrally, not in one browser.

☐ **Where should it live?**

- Your own computer or a private login: pipeline stays private, but it is only on that machine (or behind that login).
- Your own server: full control, you maintain it. About $5 to $25 a month.
- A hosted service such as Supabase: less upkeep, depends on another company. Free tier is limited; paid is about $25 a month.
- A public website: not recommended, because anyone could see which bids you're pursuing.

Answer: _____

4. Needed to start

☐ **SAM.gov API key.** Free, from your SAM.gov account (Account Details). It stays in a protected setting on the computer, never in the app's files or on GitHub. Who will register for it: you or me?
Answer: _____

The public bid data from SAM.gov carries no privacy risk. The main thing to protect is the key and your own pipeline.
